Proof Theory of Modal Logic Lecture 2: Labelled Proof Systems

Tiziano Dalmonte, Marianna Girlando

Free University of Bozen-Bolzano, University of Amsterdam

ESSLLI 2024 Leuven, 5-9 August 2024

Partial references:

- ▶ [Kanger, 1957] Spotted formulas for S5
- ▶ [Fitting, 1983], [Goré 1998] Tableaux + labels
- ▶ [Simpson, 1994], [Viganò, 1998] Natural deduction + labels
- ▶ [Mints, 1997], [Viganò, 2000], [Negri,2005] Sequent calculus + labels

We follow the approach of Negri:

- ▶ Proof analysis in modal logics [Negri, 2005]
- Contraction-free sequent calculi for geometric theories with an application to Barr's theorem [Negri, 2003]

The plan

- ▶ Labelled sequent calculus for K
- ▶ Frame conditions: a general recipe
- Semantic completeness

Labelled sequent calculus for K

Enriching the language

$$A, B ::= p \mid \bot \mid A \land B \mid A \lor B \mid A \rightarrow B \mid \Box A \mid \Diamond A$$

Enriching the language

$$A, B ::= p \mid \bot \mid A \land B \mid A \lor B \mid A \rightarrow B \mid \Box A \mid \Diamond A$$

Take countably many variables x, y, z, ... (the lables)

Enriching the language

$$A, B ::= p \mid \bot \mid A \land B \mid A \lor B \mid A \rightarrow B \mid \Box A \mid \Diamond A$$

Take countably many variables x, y, z, ... (the lables)

Labelled formulas

xRy meaning 'x has access to y'

(relational atoms)

x:A meaning 'x satisfies A'

$$A, B ::= p \mid \bot \mid A \land B \mid A \lor B \mid A \rightarrow B \mid \Box A \mid \Diamond A$$

Take countably many variables x, y, z, ... (the lables)

Labelled formulas

xRy meaning 'x has access to y'

(relational atoms)

x:A meaning 'x satisfies A'

Labelled sequent

$$\mathcal{R}, \Gamma \Rightarrow \Delta$$

where

- $\triangleright \mathcal{R}$ is a multiset of relational atoms;
- \triangleright Γ , Δ are multisets of labelled formulas *without* relational atoms.

$$A, B ::= p \mid \bot \mid A \land B \mid A \lor B \mid A \rightarrow B \mid \Box A \mid \Diamond A$$

Take countably many variables x, y, z, ... (the lables)

Labelled formulas

xRy meaning 'x has access to y'

(relational atoms)

x:A meaning 'x satisfies A'

Labelled sequent

$$\mathcal{R}, \Gamma \Rightarrow \Delta$$

where

- R is a multiset of relational atoms;
- $ightharpoonup \Gamma$, Δ are multisets of labelled formulas *without* relational atoms.

Labelled sequents lack a formula interpretation

Rules of labK

$$\mathsf{init}\,\overline{\mathcal{R},x{:}\rho,\Gamma\Rightarrow\Delta,x{:}\rho}$$

$$^{\perp_{L}}\overline{\mathcal{R}, \mathbf{x}:\perp, \Gamma \Rightarrow \Delta}$$

$$\begin{array}{c} \operatorname{init} \overline{\mathcal{R}, x : \rho, \Gamma \Rightarrow \Delta, x : \rho} \\ \\ \mathcal{R}, x : A, x : B, \Gamma \Rightarrow \Delta \\ \mathcal{R}, x : A \land B, labK: main results

Validity of sequents

Given a sequent $S = \mathcal{R}, \Gamma \Rightarrow \Delta$, and a model $\mathcal{M} = \langle W, R, v \rangle$, let $\mathsf{Lb}(S) = \{x \mid x \in \mathcal{R} \cup \Gamma \cup \Delta\}$, and $\rho : \mathsf{Lb}(S) \to W$ (interpretation).

Validity of sequents

Given a sequent $S = \mathcal{R}, \Gamma \Rightarrow \Delta$, and a model $\mathcal{M} = \langle W, R, v \rangle$, let $\mathsf{Lb}(S) = \{x \mid x \in \mathcal{R} \cup \Gamma \cup \Delta\}$, and $\rho : \mathsf{Lb}(S) \to W$ (interpretation).

Satisfiability of labelled formulas at $\mathcal M$ under ρ :

$$\mathcal{M}, \rho \Vdash xRy$$
 iff $\mathcal{M} \Vdash \rho(x)R\rho(y)$
 $\mathcal{M}, \rho \Vdash x:A$ iff $\mathcal{M}, \rho(x) \Vdash A$

Given a sequent $S = \mathcal{R}, \Gamma \Rightarrow \Delta$, and a model $\mathcal{M} = \langle W, R, v \rangle$, let $\mathsf{Lb}(S) = \{x \mid x \in \mathcal{R} \cup \Gamma \cup \Delta\}$, and $\rho : \mathsf{Lb}(S) \to W$ (interpretation).

Satisfiability of labelled formulas at $\mathcal M$ under ρ :

$$\mathcal{M}, \rho \Vdash xRy$$
 iff $\mathcal{M} \Vdash \rho(x)R\rho(y)$
 $\mathcal{M}, \rho \Vdash x:A$ iff $\mathcal{M}, \rho(x) \Vdash A$

Satisfiability of sequents at M under ρ (φ is xRy or x:A):

$$\mathcal{M}, \rho \Vdash \mathcal{R}, \Gamma \Rightarrow \Delta$$
 iff

if for all $\varphi \in \mathcal{R} \cup \Gamma$ it holds that $\mathcal{M}, \rho \Vdash \varphi$, then for some $x:D \in \Delta$ it holds that $\mathcal{M}, \rho \Vdash x:D$.

Given a sequent $S = \mathcal{R}, \Gamma \Rightarrow \Delta$, and a model $\mathcal{M} = \langle W, R, v \rangle$, let $\mathsf{Lb}(S) = \{x \mid x \in \mathcal{R} \cup \Gamma \cup \Delta\}$, and $\rho : \mathsf{Lb}(S) \to W$ (interpretation).

Satisfiability of labelled formulas at $\mathcal M$ under ρ :

$$\mathcal{M}, \rho \Vdash xRy$$
 iff $\mathcal{M} \Vdash \rho(x)R\rho(y)$
 $\mathcal{M}, \rho \Vdash x:A$ iff $\mathcal{M}, \rho(x) \Vdash A$

Satisfiability of sequents at M under ρ (φ is xRy or x:A):

$$\mathcal{M}, \rho \Vdash \mathcal{R}, \Gamma \Rightarrow \Delta$$
 iff

if for all $\varphi \in \mathcal{R} \cup \Gamma$ it holds that $\mathcal{M}, \rho \Vdash \varphi$, then for some $x:D \in \Delta$ it holds that $\mathcal{M}, \rho \Vdash x:D$.

A sequent $\mathcal{R}, \Gamma \Rightarrow \Delta$ has a countermodel iff there are \mathcal{M}, ρ such that:

- ▶ $\mathcal{M}, \rho \models \varphi$, for all $\varphi \in \mathcal{R} \cup \Gamma$, and
- ▶ $\mathcal{M}, \rho \not\models x:D$, for all $x:D \in \Delta$.

Given a sequent $S = \mathcal{R}, \Gamma \Rightarrow \Delta$, and a model $\mathcal{M} = \langle W, R, v \rangle$, let $\mathsf{Lb}(S) = \{x \mid x \in \mathcal{R} \cup \Gamma \cup \Delta\}$, and $\rho : \mathsf{Lb}(S) \to W$ (interpretation).

Satisfiability of labelled formulas at $\mathcal M$ under ρ :

$$\mathcal{M}, \rho \Vdash xRy$$
 iff $\mathcal{M} \Vdash \rho(x)R\rho(y)$
 $\mathcal{M}, \rho \Vdash x:A$ iff $\mathcal{M}, \rho(x) \Vdash A$

Satisfiability of sequents at M under ρ (φ is xRy or x:A):

$$\mathcal{M}, \rho \Vdash \mathcal{R}, \Gamma \Rightarrow \Delta$$
 iff

if for all $\varphi \in \mathcal{R} \cup \Gamma$ it holds that $\mathcal{M}, \rho \Vdash \varphi$, then for some $x:D \in \Delta$ it holds that $\mathcal{M}, \rho \Vdash x:D$.

A sequent $\mathcal{R}, \Gamma \Rightarrow \Delta$ has a countermodel iff there are \mathcal{M}, ρ such that:

- ▶ $\mathcal{M}, \rho \models \varphi$, for all $\varphi \in \mathcal{R} \cup \Gamma$, and
- ▶ $\mathcal{M}, \rho \not\models x:D$, for all $x:D \in \Delta$.

Validity of sequents in a class of frames X:

$$\models_{\mathcal{X}} \mathcal{R}, \Gamma \Rightarrow \Delta$$
 iff for any ρ and any $\mathcal{M} \in \mathcal{X}, \ \mathcal{M}, \rho \Vdash \mathcal{R}, \Gamma \Rightarrow \Delta$

Soundness of labK [Negri, 2009]

Theorem (Soundness). If $\vdash_{labK} \mathcal{R}, \Gamma \Rightarrow \Delta$ then $\models \mathcal{R}, \Gamma \Rightarrow \Delta$

Towards cut-admissibility of labK 1/2 [Negri, 2005]

Towards cut-admissibility of labK 1/2 [Negri, 2005]

Substitution on labelled formulas:

$$xRy[z/y] := xRz$$

 $y:A[z/y] := z:A$

Substitution on multisets of labelled formulas $\Gamma[z/y]$

Substitution on labelled formulas:

$$xRy[z/y] := xRz$$

 $y:A[z/y] := z:A$

Substitution on multisets of labelled formulas $\Gamma[z/y]$

Lemma (Substitution). Rule subst is hp-admissible.

$$\frac{\mathcal{R},\Gamma\Rightarrow\Delta}{\mathcal{R}[y/x],\Gamma[y/x]\Rightarrow\Delta[y/x]}$$

Substitution on labelled formulas:

$$xRy[z/y] := xRz$$

 $y:A[z/y] := z:A$

Substitution on multisets of labelled formulas $\Gamma[z/y]$

Lemma (Substitution). Rule subst is hp-admissible.

$$\frac{\mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}[y/x], \Gamma[y/x] \Rightarrow \Delta[y/x]}$$

Lemma (Weakening). Rules wk_L , wk_R are hp-admissible (φ is xRy or x:A).

$$\label{eq:wkl} \operatorname{wk_L} \frac{\mathcal{R}, \Gamma \Rightarrow \Delta}{\varphi, \mathcal{R}, \Gamma \Rightarrow \Delta} \qquad \operatorname{wk_R} \frac{\mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}, \Gamma \Rightarrow \Delta, \varphi}$$

Lemma (Invertibility).

For every rule r, if the conclusion of r is derivable with a derivation of height h, then each of its premisses is derivable, with at most the same h.

Lemma (Contraction). Rules ctr_L , ctr_R are hp-admissible (φ is xRy or x:A).

$$\operatorname{ctr_L} \frac{\varphi, \varphi, \mathcal{R}, \Gamma \Rightarrow \Delta}{\varphi, \mathcal{R}, \Gamma \Rightarrow \Delta} \qquad \operatorname{ctr_R} \frac{\mathcal{R}, \Gamma \Rightarrow \Delta, \varphi, \varphi}{\mathcal{R}, \Gamma \Rightarrow \Delta, \varphi}$$

$$\operatorname{cut} \frac{\mathcal{R}, \Gamma \Rightarrow \Delta, x{:}A \quad x{:}A, \mathcal{R}', \Gamma' \Rightarrow \Delta'}{\mathcal{R}, \mathcal{R}', \Gamma, \Gamma' \Rightarrow \Delta, \Delta'}$$

Proof systems for geometric theories, [Negri, 2003]:

"axioms-as-rules"

How to transform axioms of geometric theories (geometric implications) into rules, preserving the structural properties of the calculus.

The first-order logic formulas corresponding to the frame conditions above (and many more!) are geometric implications

A first-order signature is a tuple $\sigma = \langle c, d, \dots, f, g, \dots p, q, \dots \rangle$

- ▶ Constant symbols c, d, . . .
- ▶ Function symbols f, g, ..., each with arity > 0
- ▶ Predicate symbols p, q, ..., each with arity ≥ 0

A first-order signature is a tuple $\sigma = \langle c, d, \dots, f, g, \dots p, q, \dots \rangle$

- ▶ Constant symbols c, d, . . .
- ▶ Function symbols f, g, ..., each with arity > 0
- ▶ Predicate symbols p, q, ..., each with arity ≥ 0

A first-order language over a signature σ , denoted $\mathcal{L}(\sigma)$, consists of:

- ▶ The terms generated from a countably many variables x, y, ... using the constants and function symbols of σ ;
- ▶ The formulas generated from the terms of $\mathcal{L}(\sigma)$ and predicate symbols of σ using the operators $\bot, \land, \lor, \rightarrow, \forall, \exists$.

A first-order signature is a tuple $\sigma = \langle c, d, \dots, f, g, \dots p, q, \dots \rangle$

- ▶ Constant symbols c, d, . . .
- ▶ Function symbols f, g, ..., each with arity > 0
- ▶ Predicate symbols p, q, ..., each with arity ≥ 0

A first-order language over a signature σ , denoted $\mathcal{L}(\sigma)$, consists of:

- ▶ The terms generated from a countably many variables x, y, ... using the constants and function symbols of σ ;
- ▶ The formulas generated from the terms of $\mathcal{L}(\sigma)$ and predicate symbols of σ using the operators $\bot, \land, \lor, \rightarrow, \lor, \exists$.

A first-order language with equality over a signature σ , denoted $\mathcal{L}^{=}(\sigma)$, additionally comprises a binary predicate for equality.

A first-order signature is a tuple $\sigma = \langle c, d, \dots, f, g, \dots p, q, \dots \rangle$

- ▶ Constant symbols c, d, . . .
- ▶ Function symbols f, g, ..., each with arity > 0
- ▶ Predicate symbols p, q, ..., each with arity ≥ 0

A first-order language over a signature σ , denoted $\mathcal{L}(\sigma)$, consists of:

- The terms generated from a countably many variables x, y,... using the constants and function symbols of σ;
- ▶ The formulas generated from the terms of $\mathcal{L}(\sigma)$ and predicate symbols of σ using the operators $\bot, \land, \lor, \rightarrow, \lor, \exists$.

A first-order language with equality over a signature σ , denoted $\mathcal{L}^{=}(\sigma)$, additionally comprises a binary predicate for equality.

Example.

 $\mathcal{L}^{=}(0,suc^1,+^2,\times^2)$ is the language of arithmetic $\mathcal{L}(R^2)$ is the language we use to express frame conditions

Fix a first-order language $\mathcal{L}(\sigma)$ (with or without equality).

Fix a first-order language $\mathcal{L}(\sigma)$ (with or without equality).

A first-order theory over $\mathcal{L}(\sigma)$ is a set of closed formulas of $\mathcal{L}(\sigma)$.

Example. Peano Arithmetic and Robinson Arithmetic are first-order theories over $\mathcal{L}^{=}(0, suc, +, \times)$.

Fix a first-order language $\mathcal{L}(\sigma)$ (with or without equality).

A first-order theory over $\mathcal{L}(\sigma)$ is a set of closed formulas of $\mathcal{L}(\sigma)$.

Example. Peano Arithmetic and Robinson Arithmetic are first-order theories over $\mathcal{L}^{=}(0, suc, +, \times)$.

A geometric formula is a formula of $\mathcal{L}(\sigma)$ which does not contain \to or \forall .

Fix a first-order language $\mathcal{L}(\sigma)$ (with or without equality).

A first-order theory over $\mathcal{L}(\sigma)$ is a set of closed formulas of $\mathcal{L}(\sigma)$.

Example. Peano Arithmetic and Robinson Arithmetic are first-order theories over $\mathcal{L}^{=}(0, suc, +, \times)$.

A geometric formula is a formula of $\mathcal{L}(\sigma)$ which does not contain \to or \forall .

A geometric implication is closed formula of $\mathcal{L}(\sigma)$ of the shape:

 $\forall \vec{x}(A \rightarrow B)$, for A, B geometric formulas

Fix a first-order language $\mathcal{L}(\sigma)$ (with or without equality).

A first-order theory over $\mathcal{L}(\sigma)$ is a set of closed formulas of $\mathcal{L}(\sigma)$.

Example. Peano Arithmetic and Robinson Arithmetic are first-order theories over $\mathcal{L}^{=}(0, suc, +, \times)$.

A geometric formula is a formula of $\mathcal{L}(\sigma)$ which does not contain \rightarrow or \forall .

A geometric implication is closed formula of $\mathcal{L}(\sigma)$ of the shape:

 $\forall \vec{x}(A \rightarrow B)$, for A, B geometric formulas

A geometric theory over $\mathcal{L}(\sigma)$ is a first-order theory over $\mathcal{L}(\sigma)$ whose formulas are geometric implications.

Example. Robinson arithmetic is a geometric theory over the language $\mathcal{L}^{=}(0, suc, +, \times)$.

Geometric implications can be expressed as conjunctions of geometric axioms, i.e., closed formulas of $\mathcal{L}(\sigma)$ having the form:

$$\forall \vec{x} \left(P \to \left(\exists \vec{y}_1(Q_1) \lor \dots \lor \exists \vec{y}_m(Q_m) \right) \right)$$

- \vec{x} , $\vec{y}_1, \dots, \vec{y}_m$ are (possibly empty) vectors of variables;
- ▶ $m \ge 0$;
- ▶ P, Q_1 ,..., Q_m are (possibly empty) conjunctions of atomic formulas of $\mathcal{L}(\sigma)$;
- $\vec{y}_1, \dots, \vec{y}_m$ do not occur in \vec{P} .

Geometric implications can be expressed as conjunctions of geometric axioms, i.e., closed formulas of $\mathcal{L}(\sigma)$ having the form:

$$\forall \vec{x} \left(P \to \left(\exists \vec{y}_1(Q_1) \lor \dots \lor \exists \vec{y}_m(Q_m) \right) \right)$$

- \vec{x} , $\vec{y}_1, \dots, \vec{y}_m$ are (possibly empty) vectors of variables;
- ▶ $m \ge 0$;
- ▶ P, Q_1 ,..., Q_m are (possibly empty) conjunctions of atomic formulas of $\mathcal{L}(\sigma)$;
- $\vec{y}_1, \ldots, \vec{y}_m$ do not occur in \vec{P} .

Geometric axioms can be turned into sequent calculus rules:

$$\mathsf{GA} \frac{\Xi_1[\vec{z}_1/\vec{y}_1], \Pi, \Gamma \Rightarrow \Delta \quad \cdots \quad \Xi_m[\vec{z}_m/\vec{y}_m], \Pi, \Gamma \Rightarrow \Delta}{\Pi, \Gamma \Rightarrow \Delta}$$

- $ightharpoonup \Pi$ is the multiset of atomic formulas in P:
- $\triangleright \equiv_i$ is the multiset of atomic formulas in Q_i , for each $i \leq m$;
- $ightharpoonup \vec{z}_1, \dots, \vec{z}_m$ do not occur in $\Gamma \cup \Delta$.

Geometric implications can be expressed as conjunctions of geometric axioms, i.e., closed formulas of $\mathcal{L}(\sigma)$ having the form:

$$\forall \vec{x} \left(\stackrel{\textbf{P}}{\rightarrow} \left(\exists \vec{y}_1(Q_1) \lor \cdots \lor \exists \vec{y}_m(Q_m) \right) \right)$$

- \vec{x} , $\vec{y}_1, \dots, \vec{y}_m$ are (possibly empty) vectors of variables;
- ▶ $m \ge 0$;
- ▶ P, Q_1 ,..., Q_m are (possibly empty) conjunctions of atomic formulas of $\mathcal{L}(\sigma)$;
- $\vec{y}_1, \ldots, \vec{y}_m$ do not occur in \vec{P} .

Geometric axioms can be turned into sequent calculus rules:

$$\mathsf{GA} \frac{\Xi_1[\vec{z}_1/\vec{y}_1], \Pi, \Gamma \Rightarrow \Delta \quad \cdots \quad \Xi_m[\vec{z}_m/\vec{y}_m], \Pi, \Gamma \Rightarrow \Delta}{\Pi, \Gamma \Rightarrow \Delta}$$

- $ightharpoonup \Pi$ is the multiset of atomic formulas in P:
- $\triangleright \equiv_i$ is the multiset of atomic formulas in Q_i , for each $i \leq m$;
- $\triangleright \vec{z}_1, \dots, \vec{z}_m$ do not occur in $\Gamma \cup \Delta$.

$$\begin{split} & \operatorname{ser} \frac{xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}, \Gamma \Rightarrow \Delta} \, _{y \, \, \text{fresh}} \quad \operatorname{ref} \frac{xRx, \mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}, \Gamma \Rightarrow \Delta} \quad \operatorname{sym} \frac{yRx, xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, \mathcal{R}, \Gamma \Rightarrow \Delta} \\ & \operatorname{tr} \frac{xRz, xRy, yRz, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, yRz, \mathcal{R}, \Gamma \Rightarrow \Delta} \quad \operatorname{euc} \frac{yRz, xRy, xRz, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, xRz, \mathcal{R}, \Gamma \Rightarrow \Delta} \end{split}$$

$$\begin{split} \operatorname{ser} \frac{xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}, \Gamma \Rightarrow \Delta} \, _{y \, \operatorname{fresh}} \quad & \operatorname{ref} \frac{xRx, \mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}, \Gamma \Rightarrow \Delta} \quad \operatorname{sym} \frac{yRx, xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, \mathcal{R}, \Gamma \Rightarrow \Delta} \\ & \operatorname{tr} \frac{xRz, xRy, yRz, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, yRz, \mathcal{R}, \Gamma \Rightarrow \Delta} \quad & \operatorname{euc} \frac{yRz, xRy, xRz, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, xRz, \mathcal{R}, \Gamma \Rightarrow \Delta} \end{split}$$

For $X \subseteq \{d, t, b, 4, 5\}$, lab $K \cup X$ is defined by adding to labK the rules for frame conditions corresponding to elements of X, plus the rules obtained by to satisfy the closure condition (contracted instances of the rules):

$$\operatorname{euc} \frac{yRy, xRy, xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, xRy, \mathcal{R}, \Gamma \Rightarrow \Delta} \quad \rightsquigarrow \quad \operatorname{euc'} \frac{yRy, xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}{xRy, \mathcal{R}, \Gamma \Rightarrow \Delta}$$

Example: labK \cup {5} denotes the proof system labK \cup {euc, euc'}.

We denote by $\vdash_{labK \cup X} S$ derivability of labelled sequent S in labK $\cup X$.

For $X \subseteq \{d, t, b, 4, 5\}$:

Theorem (Soundness). If $\vdash_{\mathsf{labK} \cup \mathsf{X}} \mathcal{R}, \Gamma \Rightarrow \Delta$ then $\models_{\mathcal{X}} \mathcal{R}, \Gamma \Rightarrow \Delta$.

Example. If the premiss of rule ser is valid in all serial models, then its conclusion is valid in all serial models.

$$\operatorname{ser} \frac{\mathit{xRy}, \mathcal{R}, \Gamma \Rightarrow \Delta}{\mathcal{R}, \Gamma \Rightarrow \Delta} \, \mathit{y} \, \operatorname{fresh}$$

Lemma (Cut). The cut rule is admissible in labK \cup X:

$$\operatorname{cut} \frac{\mathcal{R}, \Gamma \Rightarrow \Delta, x : A \quad x : A, \mathcal{R}', \Gamma' \Rightarrow \Delta'}{\mathcal{R}, \mathcal{R}', \Gamma, \Gamma' \Rightarrow \Delta, \Delta'}$$

For Γ set of formulas and $x:\Gamma = \{x:G \mid \text{ for each } G \in \Gamma\}$:

Theorem (Syntactic Completeness). If $\Gamma \vdash_{\mathsf{K} \cup \mathsf{X}} A$ then $\vdash_{\mathsf{lab}\mathsf{K} \cup \mathsf{X}} x : \Gamma \Rightarrow x : A$.

$$GA_{0} = \forall \vec{x} \left(\stackrel{P}{\rightarrow} \left(\exists \vec{y}_{1}(Q_{1}) \lor \cdots \lor \exists \vec{y}_{m}(Q_{m}) \right) \right)$$

$$GA_{1} = \forall \vec{x} \left(\stackrel{P}{\rightarrow} \left(\exists \vec{y}_{1}(\bigwedge GA_{0}) \lor \cdots \lor \exists \vec{y}_{m}(\bigwedge GA_{0}) \right) \right)$$

$$GA_{n+1} = \forall \vec{x} \left(\stackrel{P}{\rightarrow} \left(\exists \vec{y}_{1}(\bigwedge GA_{k_{1}}) \lor \cdots \lor \exists \vec{y}_{m}(\bigwedge GA_{k_{m}}) \right) \right)$$
for $k_{1}, \ldots, k_{m} \ge n$

$$\begin{split} GA_0 &= \forall \vec{x} \Big(\stackrel{P}{\rightarrow} \Big(\exists \vec{y}_1(Q_1) \lor \cdots \lor \exists \vec{y}_m(Q_m) \Big) \Big) \\ GA_1 &= \forall \vec{x} \Big(\stackrel{P}{\rightarrow} \Big(\exists \vec{y}_1(\bigwedge GA_0) \lor \cdots \lor \exists \vec{y}_m(\bigwedge GA_0) \Big) \Big) \\ GA_{n+1} &= \forall \vec{x} \Big(\stackrel{P}{\rightarrow} \Big(\exists \vec{y}_1(\bigwedge GA_{k_1}) \lor \cdots \lor \exists \vec{y}_m(\bigwedge GA_{k_m}) \Big) \Big) \end{split}$$

for
$$k_1, \ldots, k_m \geq n$$

Systems of rules cover all systems of normal modal logics axiomatised by Sahlqvist formulas.

$$\begin{array}{lcl} GA_0 & = & \forall \vec{x} \left(\stackrel{P}{\rightarrow} \left(\exists \vec{y}_1(Q_1) \lor \cdots \lor \exists \vec{y}_m(Q_m) \right) \right) \\ \\ GA_1 & = & \forall \vec{x} \left(\stackrel{P}{\rightarrow} \left(\exists \vec{y}_1(\bigwedge GA_0) \lor \cdots \lor \exists \vec{y}_m(\bigwedge GA_0) \right) \right) \\ \\ GA_{n+1} & = & \forall \vec{x} \left(\stackrel{P}{\rightarrow} \left(\exists \vec{y}_1(\bigwedge GA_{k_1}) \lor \cdots \lor \exists \vec{y}_m(\bigwedge GA_{k_m}) \right) \right) \end{array}$$

for
$$k_1, \ldots, k_m \geq n$$

Systems of rules cover all systems of normal modal logics axiomatised by Sahlqvist formulas.

Gödel-Löb provability logic (GL):

Transitivity: *R* is transitive Converse well-foundedness: there are no infinite *R*-chains

$$\begin{split} GA_0 &= \forall \vec{x} \Big(\stackrel{P}{\rightarrow} \Big(\exists \vec{y}_1(Q_1) \lor \cdots \lor \exists \vec{y}_m(Q_m) \Big) \Big) \\ GA_1 &= \forall \vec{x} \Big(\stackrel{P}{\rightarrow} \Big(\exists \vec{y}_1(\bigwedge GA_0) \lor \cdots \lor \exists \vec{y}_m(\bigwedge GA_0) \Big) \Big) \\ GA_{n+1} &= \forall \vec{x} \Big(\stackrel{P}{\rightarrow} \Big(\exists \vec{y}_1(\bigwedge GA_{k_1}) \lor \cdots \lor \exists \vec{y}_m(\bigwedge GA_{k_m}) \Big) \Big) \end{split}$$

for
$$k_1, \ldots, k_m \geq n$$

Systems of rules cover all systems of normal modal logics axiomatised by Sahlqvist formulas.

Gödel-Löb provability logic (GL):

Transitivity: R is transitive

Converse well-foundedness: there are no infinite R-chains

[Negri, 2005]: labelled proof system for GL!

- ▶ Derive axiom 4, that is, $\Box A \rightarrow \Box \Box A$, in labK $\cup \{t, 5\}$. Then, show that rule tr is derivable in labK $\cup \{t, 5\} \cup \{wk_L, wk_R\}$.
- ▶ Derive axiom 5, that is, $\diamondsuit A \to \Box \diamondsuit A$, in labK $\cup \{b, 4\}$. Then, show that rule euc is derivable in labK $\cup \{b, 4\} \cup \{wk_L, wk_R\}$.
- Write down the labelled rule corresponding to the frame condition of confluence:

$$\forall x, y, z ((R(x, y) \land R(x, z)) \rightarrow \exists k (R(y, k) \land R(z, k)))$$

Write down the sequent calculus rules corresponding to the axioms of Robinson Arithmetic. Can we use the results from [Negri, 2003] to prove consistency of Robinson Arithmetic? If yes, how?
